Directorate of Intelligence
Imagery Analysis Service

ABSTRACT

This report updates the previous Basic Imagery Interpretation Reports on ten refineries, two shale oil plants, and a synthetic fuels plant in China. The latest information used in this report ranges from October 1969 to January 1970, depending on the plant.

New refining units are being added to the Ko-la-ma-i and Tu-shan-tzu refineries and to the Chin-chou Synthetic Fuels Plant, which is being modified to process only natural crude oil. Additions of unidentified function are being made to the Lan-chou, Chin-hsi, and Nan-ching refineries. No significant changes have been made to the Leng-hu, Shanghai, Pai-yang-ho, Lu-ta, and Sa-erh-tu refineries or to Fu-shun Shale Oil and Chemical Plant East. Smoke precluded analysis of the facilities at Fu-shun Shale Oil Plant West. All of the above plants were observed in operation at least once since the previous reports.

Due to the lack of coverage since the last reports, updates were not possible on the Nan-chung refinery or the Mao-ming shale oil plant.

BASIC DESCRIPTION

Since November 1968, the date of the latest photography used in the previous report, the dismantling of the shale oil retort has continued in the shale oil retort area (Area B) at this plant. All of the processing units around the retort appear to have been removed. No additional changes to the facilities were noted. The plant now processes oil recovered from the single remaining shale oil retort in Area C, as well as natural crude oil.

The plant was in operation when observed on the December 1969 photography as indicated by emissions in several of the processing areas.

25X1

BASIC DESCRIPTION

Analysis of the facilities at Fu-shun Shale Oil Plant West was precluded by smoke over the plant area on December 1969 imagery, the only coverage since the previous report.

The degree of activity within the plant could not be determined, although emissions from at least two areas of the plant indicated it was in operation.

25X1

BASIC DESCRIPTION

Construction has continued at the Lan-chou Petroleum Refinery since August 1968, the date of the latest coverage used in the previous report. Most of the construction has taken place in the unidentified processing areas (Areas A and D). Emissions have been observed coming from Area D on several occasions, but never from Area A. A small light-ends unit has been identified at the east end of the thermal cracking area (Area J), adjacent to the thermal cracking unit. The unidentified processing unit at the south end of the U/I processing area (Area G) has been identified as a possible alkylation unit, based primarily on its location in the refinery and its general appearance on the small-scale photography.

The facilities in the crude oil distillation area (Area M) which were previously identified as primary distillation units are now believed to be phenol extraction units.

The refinery was in operation on all coverage as indicated by emissions from the cooling towers and from various processing units.

BASIC DESCRIPTION

Since February 1969, the date of the latest imagery used in the previous report, construction has continued at the Nan-ching Petroleum Refinery. In the storage area under construction (Area D), the four storage tanks have been completed and several support buildings have been added. At the south end of Area D two unidentified processing units have been added.

The refinery appeared to be active in October 1969 as indicated by the presence of tankers at the river loading piers.

25X1

BASIC DESCRIPTION

No significant changes have been observed in the facilities at the Pai-yang-ho Petroleum Refinery since August 1968, the date of the latest photography used in the previous report. However, four storage tanks and several buildings have been added to the unidentified processing facility under construction in Area B.

The refinery was in operation on photography of December 1969 as indicated by emissions in several processing areas. On photography of September 1968 and May 1969, no emissions were noted in the refinery area.

25X1

25X1

BASIC DESCRIPTION

No significant changes have been observed in the facilities at the Sa-erh-tu Petroleum Refinery since November 1968, the date of the latest imagery used in the previous report.

The refinery was in operation when observed on photography of December 1969 as indicated by emissions in several processing areas, and snow melt throughout the plant. No emissions were observed within the refinery area on coverage of May and August 1969.

The unit in Area J which was identified as a probable thermal cracking unit in the previous report is now believed to be a multistage primary distillation unit. The unit in Area I previously identified as a primary distillation unit is now identified as a thermal cracking unit. The unidentified processing unit in Area K has been identified as a multistage primary distillation unit. Area I is now identified as a thermal cracking area and Areas J and K as multistage primary distillation areas.

BASIC DESCRIPTION

No significant changes have been observed in the facilities at the Shanghai Petroleum Refinery since December 1968, the date of the latest photography used in the previous report. However, minor additions have been made to the lubricating oil plant (Area F) and the probable blending and treating plant (Area B).

The refinery was in operation on all the referenced photography as indicated by emissions from the processing areas and the presence of tankers at the river loading facilities.
